

## NiCd/NiMH Fast-Charge Management ICs

### Features

- Fast charge of nickel cadmium or nickel-metal hydride batteries
- Direct LED output displays charge status
- Fast-charge termination by rate of rise of temperature, maximum voltage, maximum temperature, and maximum time
- Internal band-gap voltage reference
- Optional top-off charge (bq2002T only)
- Selectable pulse-trickle charge rates (bq2002T only)
- Low-power mode
- 8-pin 300-mil DIP or 150-mil SOIC

### General Description

The bq2002D/T Fast-Charge IC are low-cost CMOS battery-charge controllers able to provide reliable charge termination for both NiCd and NiMH battery applications. Controlling a current-limited or constant-current supply allows the bq2002D/T to be the basis for a cost-effective stand-alone or system-integrated charger. The bq2002D/T integrates fast charge with optional top-off and pulsed-trickle control in a single IC for charging one or more NiCd or NiMH battery cells.

Fast charge is initiated on application of the charging supply or battery replacement. For safety, fast charge is inhibited if the battery temperature and voltage are outside configured limits.

Fast charge is terminated by any of the following:

- Rate of temperature rise
- Maximum voltage
- Maximum temperature
- Maximum time

After fast charge, the bq2002T optionally tops-off and pulse-trickles the battery per the pre-configured limits. Fast charge may be inhibited using the INH pin. The bq2002D/T may be placed in low-standby-power mode to reduce system power consumption.

## Functional Description

Figures 2 and 3 show state diagrams of bq2002D/T and Figure 4 shows the block diagram of the bq2002D/T.

### Battery Voltage and Temperature Measurements

Battery voltage and temperature are monitored for maximum allowable values. The voltage presented on the battery sense input, BAT, should represent a single-cell potential for the battery under charge. A resistor-divider ratio of

$$\frac{\text{RB1}}{\text{RB2}} = \text{N} - 1$$

is recommended to maintain the battery voltage within the valid range, where N is the number of cells, RB1 is the resistor connected to the positive battery terminal, and RB2 is the resistor connected to the negative battery terminal. See Figure 1.

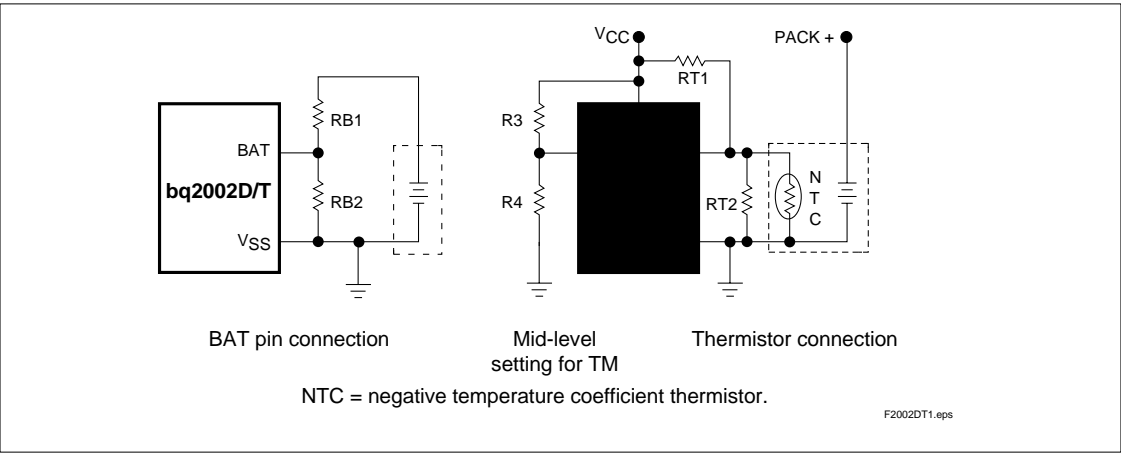

Figure 1. Voltage and Temperature Monitoring and TM Pin Configuration

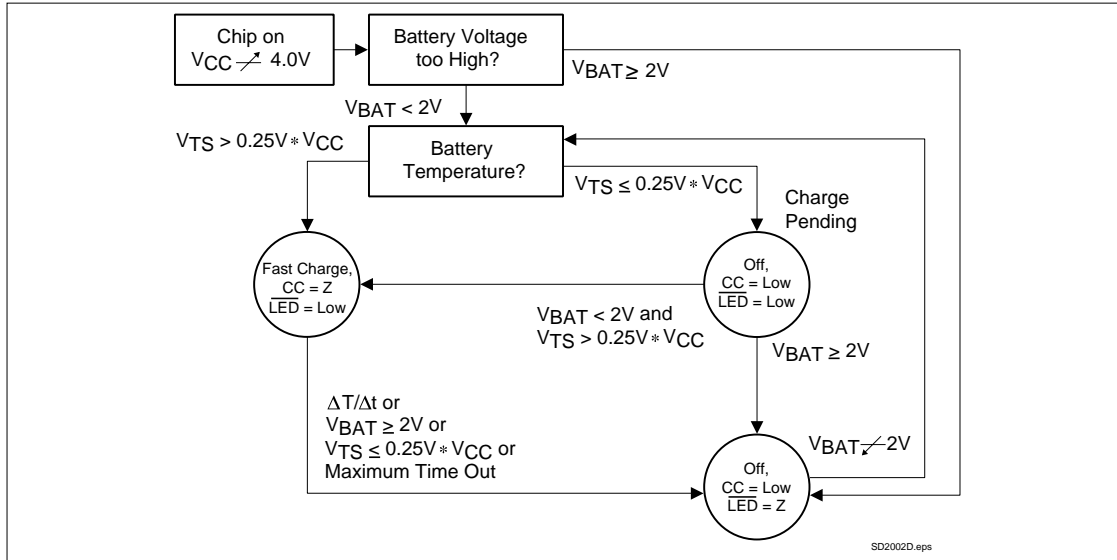

Figure 2. bq2002D State Diagram

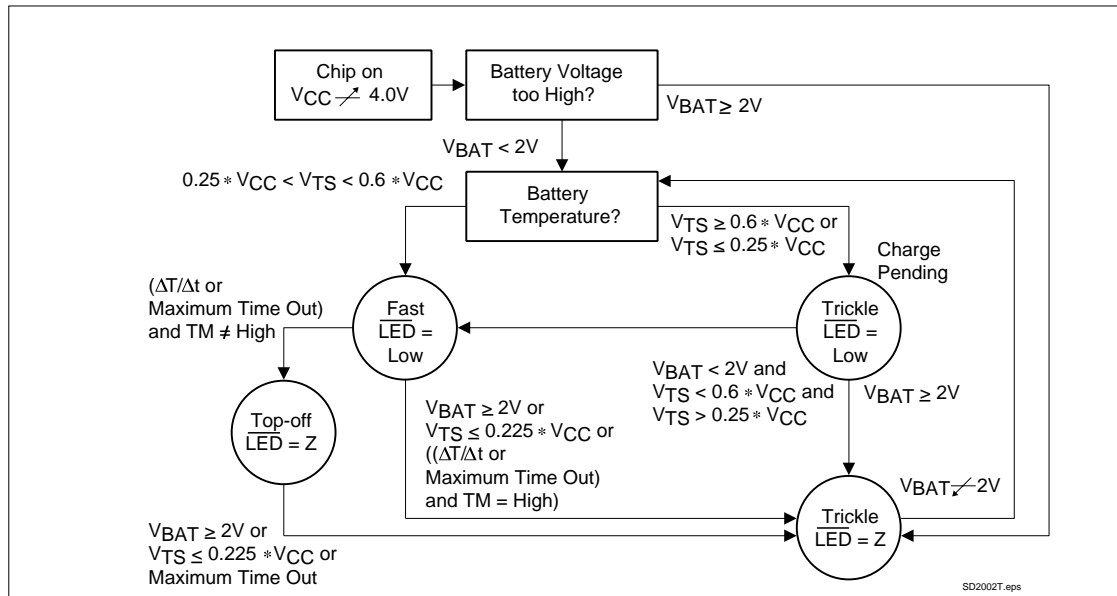

Figure 3. bq2002T State Diagram

## bq2002D/T

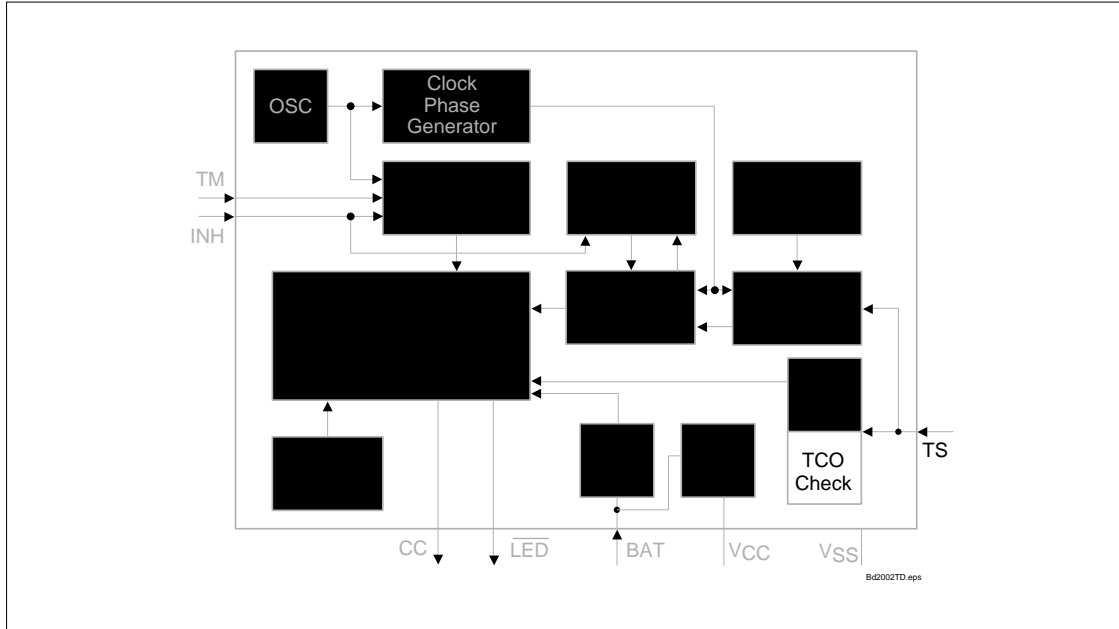

Figure 4. Block Diagram

**Note:** This resistor-divider network input impedance to end-to-end should be at least 200kΩ and less than 1 MΩ.

A ground-referenced negative temperature coefficient thermistor placed in proximity to the battery may be used as a low-cost temperature-to-voltage transducer. The temperature sense voltage input at TS is developed using a resistor-thermistor network between VCC and VSS. See Figure 1.

### Starting A Charge Cycle

Either of two events starts a charge cycle (see Figure 5):

1. Application of power to VCC or
2. Voltage at the BAT pin falling through the maximum cell voltage where

$$V_{MCV} = 2V \pm 5\%$$

If the battery is within the configured temperature and voltage limits, the IC begins fast charge. The valid battery voltage range is  $V_{BAT} < V_{MCV}$ . The valid temperature range is  $V_{HTF} < V_{TS} < V_{LTF}$  for the bq2002T and  $V_{HTF} < V_{TS}$  for the bq2002D where

$$V_{LTF} = 0.4 * V_{CC} \pm 5\%$$

$$V_{HTF} = 0.25 * V_{CC} \pm 5\% \text{ (bq2002T only)}$$

If the battery voltage or temperature is outside of these limits, the IC pulse-trickle charges until the temperature falls within the allowed fast charge range or a new charge cycle is started.

Fast charge continues until termination by one or more of the four possible termination conditions:

- Rate of temperature rise
- Maximum voltage
- Maximum temperature
- Maximum time

### T/ t Termination

The bq2002D/T samples at the voltage at the TS pin every 19s and compares it to the value measured three samples earlier. If the voltage has fallen 25.6mV or more, fast charge is terminated. The  $\Delta T/\Delta t$  termination test is valid only when  $V_{TCO} < V_{TS} < V_{LTF}$  for the bq2002T and  $V_{TCO} < V_{TS}$  for the bq2002D.

### Temperature Sampling

A sample is taken by averaging together 16 measurements taken 57μs apart. The resulting sample period (18.18ms) filters out harmonics around 55Hz. This tech-

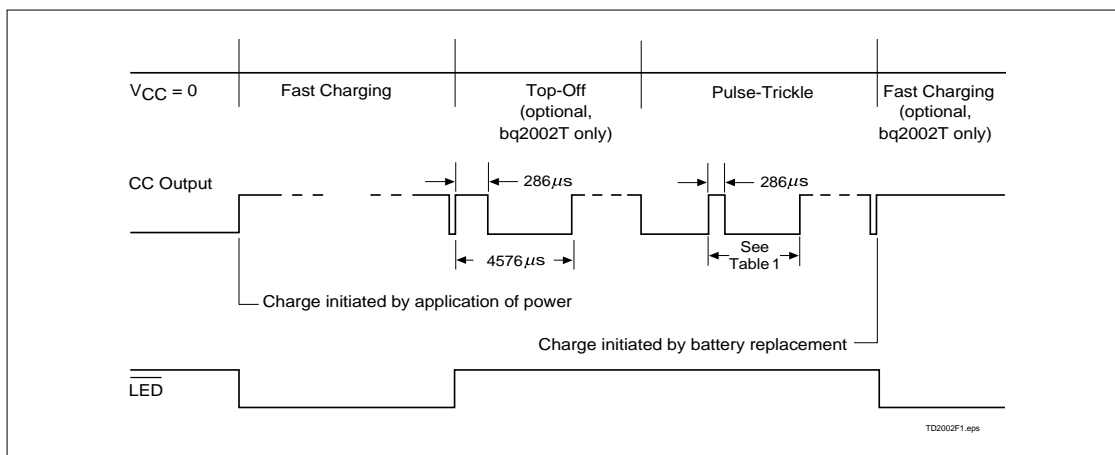

Figure 5. Charge Cycle Phases

nique minimizes the effect of any AC line ripple that may feed through the power supply from either 50Hz or 60Hz AC sources. Tolerance on all timing is  $\pm 20\%$ .

#### Maximum Voltage, Temperature, and Time

Any time the voltage on the BAT pin exceeds the maximum cell voltage,  $V_{MCV}$ , fast charge or optional top-off charge is terminated.

Maximum temperature termination occurs anytime the voltage on the TS pin falls below the temperature cut-off threshold  $V_{TCO}$  where

$$V_{TCO} = 0.225 * V_{CC} \pm 5\%$$

Maximum charge time is configured using the TM pin. Time settings are available for corresponding charge rates of C/4, 1C, and 2C. Maximum time-out termination is enforced on the fast-charge phase, then reset, and

Table 1. Fast-Charge Safety Time/Top-Off Table

| Part No. | Corresponding Fast-Charge Rate | TM   | Typical Fast-Charge and Top-Off Time Limits (minutes) | Top-Off Rate | Pulse-Trickle Rate | Pulse-Trickle Period (ms) |
|----------|--------------------------------|------|---|--------------|--------------------|---------------------------|
| bq2002D  | C/4                            | Mid  | 440   | None         | None               | None                      |
|          | 1C                             | Low  | 110   | None         | None               | None                      |

**Notes:** Typical conditions =  $25^{\circ}\text{C}$ ,  $V_{CC} = 5.0\text{V}$   
Mid =  $0.5 * V_{CC} \pm 0.5\text{V}$   
Tolerance on all timing is  $\pm 20\%$

## bq2002D/T

---

enforced again on the top-off phase, if selected (bq2002T only). There is no time limit on the trickle-charge phase.

### Top-off Charge—bq2002T Only

An optional top-off charge phase may be selected to follow fast charge termination for 1C and C/4 rates. This phase may be necessary on NiMH or other battery chemistries that have a tendency to terminate charge prior to reaching full capacity. With top-off enabled, charging continues at a reduced rate after fast-charge termination for a period of time selected by the TM pin. (See Table 1.) During top-off, the CC pin is modulated at a duty cycle of 286µs active for every 4290µs inactive. This modulation results in an average rate 1/16th that of the fast charge rate. Maximum voltage, time, and temperature are the only termination methods enabled during top-off.

### Pulse-Trickle Charge—bq2002T Only

Pulse-trickle is used to compensate for self-discharge while the battery is idle in the charger. The battery is pulse-trickle charged by driving the CC pin active for a period of 286µs for every 72.9ms of inactivity for 1C and 2C selections, and 286µs for every 17.9ms of inactivity for C/4 selection. This results in a trickle rate of C/256 for the top-off enabled mode and C/128 otherwise.

### TM Pin

The TM pin is a three-level pin used to select the charge timer, top-off, voltage termination mode, trickle rate, and voltage hold-off period options. Table 1 describes the states selected by the TM pin. The mid-level selection input is developed by a resistor divider between V<sub>CC</sub> and ground that fixes the voltage on TM at V<sub>CC</sub>/2 ± 0.5V. See Figure 5.

### Charge Status Indication

In the fast charge and charge pending states, and whenever the inhibit pin is active, the  $\overline{\text{LED}}$  pin goes low. The  $\overline{\text{LED}}$  pin is driven to the high-Z state for all other conditions. Figure 3 outlines the state of the  $\overline{\text{LED}}$  pin during charge.

### Charge Inhibit

Fast charge and top-off may be inhibited by using the INH pin. When high, INH suspends all fast charge and top-off activity and the internal charge timer. INH freezes the current state of  $\overline{\text{LED}}$  until inhibit is removed. Temperature monitoring is not affected by the INH pin. During charge inhibit, the bq2002D/T continues to pulse-trickle charge the battery per the TM selection. When INH returns low, charge control and the charge timer resume from the point where INH became active. The V<sub>TS</sub> sample history is cleared by INH.

### Low-Power Mode

The IC enters a low-power state when V<sub>BAT</sub> is driven above the power-down threshold (V<sub>PD</sub>) where

$$V_{PD} = V_{CC} - (1V \pm 0.5V)$$

Both the CC pin and the  $\overline{\text{LED}}$  pin are driven to the high-Z state. The operating current is reduced to less than 1µA in this mode. When V<sub>BAT</sub> returns to a value below V<sub>PD</sub>, the IC pulse-trickle charges until the next new charge cycle begins.

## Absolute Maximum Ratings

| Symbol              | Parameter   | Minimum | Maximum | Unit | Notes      |
|---------------------|---|---------|---------|------|------------|
| V <sub>CC</sub>     | V <sub>CC</sub> relative to V <sub>SS</sub>   | -0.3    | +7.0    | V    |            |
| V <sub>T</sub>      | DC voltage applied on any pin excluding V <sub>CC</sub> relative to V <sub>SS</sub> | -0.3    | +7.0    | V    |            |
| T <sub>OPR</sub>    | Operating ambient temperature   | 0       | +70     | °C   | Commercial |
| T <sub>STG</sub>    | Storage temperature   | -40     | +85     | °C   |            |
| T <sub>SOLDER</sub> | Soldering temperature   | -       | +260    | °C   | 10s max.   |
| T <sub>BIAS</sub>   | Temperature under bias  | -40     | +85     | °C   |            |

**Note:** Permanent device damage may occur if **Absolute Maximum Ratings** are exceeded. Functional operation should be limited to the Recommended DC Operating Conditions detailed in this data sheet. Exposure to conditions beyond the operational limits for extended periods of time may affect device reliability.

## DC Thresholds (T<sub>A</sub> = 0 to 70°C; V<sub>CC</sub> ±20%)

| Symbol           | Parameter              | Rating                  | Tolerance | Unit | Notes  |
|------------------|------------------------|-------------------------|-----------|------|--|
| V <sub>TCO</sub> | Temperature cutoff     | 0.225 * V <sub>CC</sub> | ±5%       | V    | V <sub>TS</sub> ≤ V <sub>TCO</sub> terminates fast charge and top-off        |
| V <sub>HTF</sub> | High-temperature fault | 0.25 * V <sub>CC</sub>  | ±5%       | V    | V <sub>TS</sub> ≤ V <sub>HTF</sub> inhibits fast charge start                |
| V <sub>LTF</sub> | Low-temperature fault  | 0.4 * V <sub>CC</sub>   | ±5%       | V    | V <sub>TS</sub> ≥ V <sub>LTF</sub> inhibits fast charge start (bq2002T only) |
| V <sub>MCV</sub> | Maximum cell voltage   | 2                       | ±5%       | V    | V <sub>BAT</sub> ≥ V <sub>MCV</sub> inhibits/terminates fast charge          |

## bq2002D/T

### Recommended DC Operating Conditions (T<sub>A</sub> = 0 to 70°C)

| Symbol           | Condition                         | Minimum                  | Typical | Maximum                  | Unit | Notes   |

## bq2002D/T

---

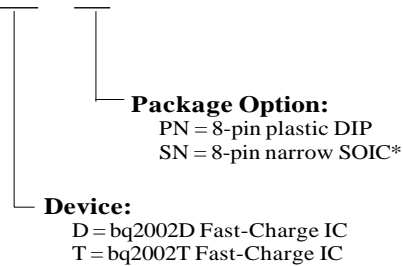

### Data Sheet Revision History

| Change No. | Page No. | Description   | Nature of Change         |
|------------|----------|---|--------------------------|
| 1          | 3        | Was: Table 1 gave the bq2002D/T Operational Summary.<br>Is: Figure 2 gives the bq2002D/T Operational Summary. | Changed table to figure. |
| 1          | 5        | Added top-off values.   | Added column and values. |
| 2          | All      | Revised and expanded this data sheet  |                          |
| 3          | All      | Revised and included bq2002D  | Addition of device       |
| 4          |          | Specified package information for the bq2002D   |                          |
| 5          | 1, 5     | Corrected transposed rows in Selection Guide Table and made Table 1 consistent with Selection Guide.          |                          |

**Notes:** Change 1 = Sept. 1996 B changes from Aug. 1994.

### Ordering Information

#### bq2002

\* bq2002D is only available in the 8-pin narrow SOIC package

## **IMPORTANT NOTICE**

Texas Instruments and its subsidiaries (TI) reserve the right to make changes to their products or to discontinue any product or service without notice, and advise customers to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current and complete. All products are sold subject to the terms and conditions of sale supplied at the time of order acknowledgment, including those pertaining to warranty, patent infringement, and limitation of liability.

TI warrants performance of its semiconductor products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are utilized to the extent TI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

Customers are responsible for their applications using TI components.

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards must be provided by the customer to minimize inherent or procedural hazards.

TI assumes no liability for applications assistance or customer product design. TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of TI covering or relating to any combination, machine, or process in which such semiconductor products or services might be or are used. TI's publication of information regarding any third party's products or services does not constitute TI's approval, warranty or endorsement thereof.
